

VIDYASAGAR UNIVERSITY

PROJECT REPORT

On

Online Quiz Examination System

SUBMITTED TO

DEPT. OF COMPUTER SCIENCE & APPLICATION

IN PARTIAL FULLFILLMENT
OF THE DEGREE OF
BACHELOR OF COMPUTER SCIENCE

By

Name: Nilesh Senapati
Roll No: 1126136-220188
Reg. No-VU221361956

Name: Subhrajit Jana
Roll No: 1126136-220207
Reg. No-VU221362195

Name: Harekrishna Nandi
Roll No: 1126136-220186
Reg. No-VU221361896

Name: Supriya Bandhu Shit
Roll No: 1126136-220186
Reg. No-VU221362244

Under the Guidance of
Mrs. Paulami Basu Ray
Assistant Professor
Prabhat Kumar College

CERTIFICATE OF ORIGINALITY

This is to certify that the project report entitled “ONLINE QUIZ EXAMINATION SYSTEM” Submitted to Prabhat Kumar College, in partial fulfillment of the requirement for the award of the degree of Bachelor in Computer Science Honours, is an original work carried out by Nilesh Senapati, Subhrajit Jana, Harekrishna Nandi & Supriya Bandhu Shit.

The matter embodied in this project is a genuine work done by the students and has not been submitted whether to this University or to any other University / Institute for the fulfillment of the requirement of any course of study.

Signature of the Guide

Name: Mrs. Paulami Basu Ray

Designation: Assistant Professor

DECLARATION

We do hereby declare that the project work entitled “Online Quiz Examination system” submitted by us for the partial fulfillment of the requirement for the award of Bachelor in Computer Science is an authentic work completed by us. The report being submitted has not been submitted earlier for the award of any degree or diploma to any Institute or University.

We, the students of B.Sc in Computer Science, Semester VI (2025) hereby declare that the project Report submitted to Prabhat Kumar College has been entirely programmed by us to fulfil the requirement of the final Year project. We declare that this project has been completed within time. The information submitted by us is true and original to the best of our knowledge.

ACKNOWLEDGEMENT

We convey our sincere gratitude to for giving us the opportunity to prepare our project work in online quiz examination system. We express our sincere thanks to all the Staff members of department of computer.

We are thankful to Mrs. Paulami Basu Ray for his guidance during our project work and sparing his valuable time for the same.

We express our sincere obligation and thanks to the Principal and all Faculties of the Department of Computer Science, Prabhat Kumar College, for providing us with guidance, help, motivation and valuable advice at every stage for completing the project work successfully.

Introduction & Objectives

These days, *Online quiz examination system* is a web-based examination system where examinations are given online. either through the internet or intranet using computer system. The main goal of this online quiz examination system is to effectively evaluate the student thoroughly through a totally automated system that not only reduce the required time but also obtain fast and accurate results.

The online quiz examination system is an electronic application. This framework will help the college/institution to access the inquiry have different alternatives with one right reply. These days Online quiz Examination System is considered a fast-developing examination method because of its speed, accuracy and also because of pandemic. Virtually all organizations today, are managing their exams by online quiz examination system, meanwhile it reduces student's time in examinations. It is also needed less manpower to handle the examination. Therefore, of this, the result is calculated in less time. It also helps diminishing the need for paper. Online quiz examination project is very beneficial to learn it, according to today's requirement Online quiz examination system is significantly important to the educational institution to prepare the exams, saving the time and effort that is required to check the exam papers and to prepare the results reports. Online quiz examination system helps the educational institutions to monitor their students and keep eyes

on their progress. The best use of this system in Academic Institute like school, college and training centers because it helps in managing the exams and get the results in easy and an efficient manner.

- ✚ Online quiz examination will diminish the rushed occupation of estimating the answers given by the applicants physically.
- ✚ Being a coordinated online quiz examination framework, it will decrease paper work.
- ✚ To permit workforce to make exams and answer key.
- ✚ To permit programmed reviewing and manual evaluating which can be recorded per test.
- ✚ Responses by the candidates will be checked automatically.
- ✚ It reduces time consumption.

Features

User Side-

- ✚ New User Registration for Online quiz examination with Confirmation Email Feature.
- ✚ User can Login into System using Email ID and Password
- ✚ User can manage his or her profile details.
- ✚ User can change his or her password.
- ✚ User can view available examination list.
- ✚ User can enroll into examination.
- ✚ User can attend online quiz examination at the define date and time.
- ✚ User can view the history of exam which he or she had enrol.
- ✚ User can view the exam result on Web page and in PDF format also.

TOOLS / ENVIRONMENT USED

Those tools that we are concentrates to design the system are

Back-end design tool:

Python (Flask Framework) will be used in developing and managing the back end of the system for handling server-side logic and routing.

Flask is a lightweight, open-source Python web framework used to build web applications. It provides tools, libraries, and technologies that allow the web application to scale with ease.

Flask is a web application framework.

A web framework simplifies the process of building web servers and dynamic websites. It provides tools to handle HTTP requests, manage sessions, route URLs, and render templates. To process and manage data, Flask works in combination with Python code and file-based storage such as JSON.

The application data is stored in **JSON** files.

JSON (JavaScript Object Notation) is a lightweight data-interchange format that is easy for humans to read and write and easy for machines to parse and generate. It is widely used for storing quiz questions, user profiles, results, and other information. JSON helps maintain structured data in a simple, portable format.

The Python part of the backend includes user authentication, quiz

evaluation, and result recording.

Flask is Open Source.

Open Source means that it is possible for anyone to use and modify the software. Anybody can download Flask and its libraries from the internet and use them freely. Flask uses the BSD license, allowing developers to study and change it to suit their project needs.

Flask works in a client/server architecture.

The web browser (client) interacts with the server-side Flask application via HTTP requests. Flask processes these requests and returns HTML pages or data (such as JSON responses). This model allows seamless interaction between frontend and backend components.

The Flask framework is simple, lightweight, and flexible.

Flask applications are easy to deploy and scale. It is suitable for small and medium-scale web applications like quiz platforms. Its simplicity and modular design make it a good choice for educational projects.

Front-end design tools:

HTML is used to structure the content of the web application. It defines the layout of login/signup forms, quiz interfaces, dashboards, and results.

CSS and Tailwind CSS are used for designing and styling the application. Tailwind CSS is a utility-first framework that allows rapid UI development with predefined classes for spacing, colors, and responsiveness.

JavaScript handles the interactive behavior of the application. It dynamically loads quiz questions, tracks user answers, calculates scores, and displays feedback.

JavaScript is essential for client-side processing and enhances user experience by enabling smooth transitions, dynamic content rendering, and animations.

○ Front end design tool:

The user interface will be developed using web technologies like HTML, CSS, and JavaScript.

HTML is used to build the structure of the webpages, CSS is used to style them, and JavaScript adds interactivity to enhance the user experience.

JavaScript is a client-side scripting language used to build dynamic features on the webpage. It interprets scripts at runtime, allowing real-time interaction without reloading the page. JavaScript is embedded into HTML and runs in the web browser, which makes it ideal for tasks such as form validation, dynamic content updates, and user interaction handling. Being supported by all major browsers by default, JavaScript is a cost-effective and flexible choice for modern web development.

- JavaScript is continuously updated to stay in line with modern web development practices.
- Another benefit of using JavaScript is that it runs on the client side; no special setup is needed on the server for basic operations.
- It only requires a browser on the client system to function, which ensures broad compatibility.

Other tools used in the system include:

- **Microsoft Office 2007 for documentation.**

Microsoft Office 2007 is a widely-used suite of productivity tools, including Word, Excel, and PowerPoint, useful for creating reports, presentations, and maintaining structured documentation of the project.

- **Notepad++, Sublime Text 3, or Visual Studio Code.**

Visual Studio Code is a powerful, lightweight code editor with extensive support for web development. It includes IntelliSense for smart code completion, a wide range of extensions, and support for Python, HTML, CSS, and JavaScript.

Sublime Text and Notepad++ are also efficient code editors, offering features like syntax highlighting, multiple selection editing, and plugin support.

Sublime Text also includes a Python API for adding custom functionality.

- **Adobe Photoshop: for image editing.**

Photoshop is used for creating and editing graphics such as banners, logos, and UI images. It is one of the most powerful tools for producing high-quality visuals for web applications.

- **Methodology of the project:**

In developing this system some methods will be applied in order to accomplish in an effective manner.

- **Data collection methodology**

Data collection is one of the important tasks to analyze how the activities can be done in the proposed system.

- **Interview:** we use this technique to get direct information to those who run the traditional system, the principal of the school and other related persons who have knowledge of alumni.
- **Practical Observation:** we observe physically the current existing system done manually to collect additional information and analysing their difficulties and we observe other social Medias like face book.

ANALYSIS

Data Flow Diagrams (DFD)

- DFD, Data flow diagrams are used to graphically represent the flow of data in a business information system. DFD describes the processes that are involved in a system to transfer data from the input to the file storage and reports generation.
- Data flow diagrams can be divided into logical and physical. The logical data flow diagram describes flow of data through a system to perform certain functionality of a business. The physical data flow diagram describes the implementation of the logical data flow.
- DFD graphically representing the functions, or processes, which capture, manipulate, store, and distribute data between a system and its environment and between components of a system. The visual representation makes it a good communication tool between User and System designer. Structure of DFD allows starting from a broad overview and expands it to a hierarchy of detailed diagrams.

- In Software engineering DFD (data flow diagram) can be drawn to represent the system of different levels of abstraction. Higher level DFDs are partitioned into low levels-hacking more
- Information and functional elements. Levels in DFD are numbered 0, 1, 2 or beyond. Here, we will see mainly 3 levels in data flow diagram, which are: 0-level DFD, 1-level DFD, and 2-level DFD.

Levels in Data Flow Diagrams (DFD)

- **0-level DFD:**

It is also known as context diagram. It's designed to be an abstraction view, showing the system as a single process with its relationship to external entities. It represents the entire system as single bubble with input and output data indicated by incoming/outgoing arrows.

- **1-level DFD:**

In 1-level DFD, context diagram is decomposed into multiple bubbles/processes. in this level we highlight the main functions of the system and breakdown the high-level process of o-level DFD into sub processes.

- **2-level DFD:**

2-level DFD goes one step deeper into parts of 1-level DFD. It can be used to plan or record the specific/necessary detail about the system's functioning.

- **ER Diagram**

Entity relationship diagram displays the relationships of entity set stored in a database. In other words, we can say that ER diagrams help you to explain the logical structure of databases. At first look, an ER diagram looks very similar to the flowchart. However, ER Diagram includes many specialized symbols, and its meanings make this model unique.

- **Components of the ER Diagram**

This model is based on three basic concepts: Entities, Attributes, Relationships

- **ENTITY RELATIONAL (ER) MODEL**

Is a high-level conceptual data model diagram. ER modeling helps us to analyze data requirements systematically to produce a well-designed database. The Entity-Relation model represents real-world entities and the relationship between them. It is considered a best practice to complete ER modeling before implementing one's database.

- It displays the relationships of entity set stored in a database. In other words, we can say that ER diagrams help us to explain the logical structure of databases. At first look, an ER diagram looks very similar to the flowchart. However, ER Diagram includes many specialized symbols, and its meanings make this model unique. The purpose of ER Diagram is to represent the entity framework infrastructure.

DESIGN

The purpose of designing is to show how the system is built and to obtain clear and enough information needed to make the actual implementation of the system. It is based on understanding of the model the software built on. The objectives of design are to model the system with high quality.

Implementing of high-quality system depend on the nature of design created by the designer. If one want to changes to the system after it has been put in to operation depends on the quality of the system design. So if the system is design effectively, it will be easy to make changes to it.

During system design, we focus on the processes, data structures, and software and hardware components necessary to implement it. The challenge of system design is that many conflicting criteria and constraints need to be met when decomposing the system.

1.1.Class type architecture

The architecture which will be used for the proposed system is a two-tier architecture where the first tier is the client or the user side is a web browser containing user interfaces like data entry interfaces; it is used to display information to the user. User

directly interacts with the system through the interfaces on this layer. The second layer is the storage layer (server side) which is the MySQL database that stores the data. This increase the extensibility, maintainability and portability of the new system. This class type architecture includes interface class, controller class, business class, system class, and persistence class and persistence store.

Interface classes: - These classes initiate access to the logic of our system and this interface class is the UI classes that provide people access to our system. An example of interface class is login interface class.

Business classes: - These classes implement the concepts and focusing on the data aspects of the business objects, plus behaviors specific to individual objects of the system. Examples:- Record new member, uploading file, delivering information and generate discussion forum.

Controller classes: - These classes implement business logic that involves collaborating with several domain classes or even other process classes.

Examples of Controller classes are password, user name and account type.

Persistence classes: - These classes can be used to the capability of store, retrieve, and delete objects permanently without revealing details of the underlying storage technology.

Example of this class is database class.

System classes: - These classes provide operating-system-specific functionality for your applications, isolating your software from the operating system (OS) by initiating OS-specific features, increasing the portability of your application.

Persistence store: -These classes can be used to store data permanently on the database that we can retrieve by other classes.

All types of classes interact with system classes. This is because new systems layer implements fundamental software features.

Architecture of the system

TESTING

○ UNIT TESTING

Unit testing is a level of software testing where individual units/ components of software are tested. The purpose is to validate that each unit of the software performs as designed. A unit is the smallest testable part of any software. It usually has one or a few inputs and usually a single output. In procedural programming, a unit may be an individual program, function, procedure, etc. in object-oriented programming, the smallest unit is a method,

which may belong to a base/ super class, abstract class or derived/ child class. (Some treat a module of an application as a unit. It is concerned with functional correctness of the standalone modules. The main aim is to isolate each unit of the system to identify, analyze and fix the defects. A unit test is a way of testing a unit – the smallest piece of code that can be logically isolated in a system. In most programming languages, that is a function, a subroutine, a method or property. The isolated part of the definition is important.

Unit Testing Techniques:

- **Black Box Testing** - Using which the user interface, input and output are tested.
- **White Box Testing** - used to test each one of those functions behaviors is tested.
- **Gray Box Testing** - Used to execute tests, risks and assessment methods.
- **Integration Testing**

Integration Testing is a level of software testing where individual units are combined and tested as a group. The purpose of this level of testing is to expose faults in the interaction between integrated units. Test drivers and test stubs are used to assist in Integration Testing. It is defined as a type of testing where software modules are integrated logically and tested as a group. A typical software project consists of multiple software modules, coded by different programmers. The purpose of this level of testing is to expose defects in the interaction between these software modules when they are Integrated Integration Testing focuses on checking data communication amongst these modules. Hence it is also termed as '**I & T**' (Integration and Testing), '**String Testing**' and sometimes '**Thread Testing**'.

Approaches, Strategies, Methodologies of Integration Testing

Software Engineering defines variety of strategies to execute Integration testing, viz.

- Big Bang Approach
- Incremental Approach: which is further divided into the following
 - Top-Down Approach
 - Bottom-Up Approach
 - Sandwich Approach - Combination of Top Down and Bottom Up

System Testing

System Testing is a level of testing that validates the complete and fully integrated software product. The purpose of a system test is to evaluate the end-to-end system specifications. Usually, the software is only one element of a larger computer-based system. Ultimately, the software is interfaced with other software/hardware systems. System Testing is actually a series of different tests whose sole purpose is to exercise the full computer-based system.

System Testing is carried out on the whole system in the context

of either system requirement specifications or functional requirement specifications or in the context of both. System testing tests the design and behavior of the system and also the expectations of the customer. It is performed to test the system beyond the bounds mentioned in the software requirements specification (SRS).

In system testing, integration testing passed components are taken as input. The goal of integration testing is to detect any irregularity between the units that are integrated together. System testing detects defects within both the integrated units and the whole system. The result of system testing is the observed behavior of a component or a system when it is tested. System Testing is basically performed by a testing team that is independent of the development team that helps to test the quality of the system impartial. It has both functional and non-functional testing. System Testing is a black-box testing. It is performed after the integration testing and before the acceptance testing.

Types of System Testing

- **Performance Testing:**

Performance Testing is a type of software testing that is carried out to test the speed, scalability, stability and

reliability of the software product or application.

- **Load Testing:**

Load Testing is a type of software Testing which is carried out to determine the behavior of a system or software product under extreme load.

- **Stress Testing:**

Stress Testing is a type of software testing performed to check the robustness of the system under the varying loads.

- **Scalability Testing:**

Scalability Testing is a type of software testing which is carried out to check the performance of a software application or system in terms of its capability to scale up or scale down the number of user request load.

System testing is important since:

a) In Software Development Life Cycle the System Testing is perform as the first level of **testing** where the System is tested as a whole.

b) System Testing enables you to test, validate and verify both the Application Architecture and Business requirement

In our project we are testing whether the student is authorized or not. When student want to register themselves, it will check whether the student id and name entered is the same as in the database. If authorized student has login, they can register themselves. If not authorized then, back to main page. We are also checking the admin login whether it is authorized or not. Only authorized admin can login. No one can register themselves as admin. Admin can change username and password in admin page only. Member login is also verified from the database values.

Welcome to PROQUIZ

1. How do you initialize an array in C?

int arr[3] = (1,2,3);

int arr(3) = (1,2,3);

int arr[3] = {1,2,3};

int arr(3) = (1,2,3);

In C, the correct way to initialize an array is using curly braces with equal sign and square brackets.

ADVANTAGES OF ONLINE EXMINATION SYSTEM:

- Online quiz examination System is a computerized system which gives instant results and also saves time.
- It fully automates the previous manual process of taking written exams.
- It is implemented by web based online quiz examination software or through Intranet variance. It decreases the need of supervision during the exam is being examine or taken using web based Online quiz examination System gives a high level of clarity as opposite of traditional method. Most of Online quiz examination System gives the result and instantly.
- In high school, Online quiz examination System is able to reduce the workload of teachers by using automated test paper exams and marking schemes.
- Students can study independently for example at home or any place.
- The amount of time given at a particular question gives you the ability of “Quick Learning Quick Thinking.”
- The data in Online quiz examination System is regenerated repeatedly so that students have access to new data.

DISADVANTAGES OF ONLINE QUIZ EXAMINATION SYSTEM:

- The question and answers may be tricky and confusing as there are multiple choices for answers.
- Lack of interaction between the teacher and student.
- Network problems may arise in Online quiz examination System, test may be postponed or cancel.
- As India is not a fully developed country problem may arise in rural areas where there is deficiency of computers or where computers are not yet discovered.
- Hackers can easily manage to achieve confidential data through fake online application or websites.
- While attempting online quiz exams we can easily manage to open another window on existing computer.
- Teaching techniques of an instructor or teacher may vary from online quiz exam questions.

FUTURE SCOPE OF ONLINE QUIZ EXAMINATION SYSTEM:

- Online quiz examination System is widely used as compared to other exams. Online quiz examination system can be used in private institutes as well as educational institution.
- It is user friendly web base application it can be used anywhere and anytime.
- The main purpose of the system is to efficiently evaluate the candidate thoroughly through a fully automated system that not only saves a lot of time but also gives fast result and saves paper.
- The faculty prepares the tests and question for each exam.
- The question are shuffled in a random order so that possibility for getting questions in the same order for the student how are beside, it is very less.

Feasibility Study

- **Technical Feasibility**

Building this system is technically feasible. The hardware and software needed are all available, it not difficult to get them. Brief I can say the necessary resources needed for the development and maintenance of the system are available. I am going to use “PHP and MySQL”.

- **Operationally Feasibility**

The project I am developing is operationally feasible as there is no need for users to have good knowledge in computer before using it. The user can learn and use the system with easiness; he just needs to read the manual or tutorial from the developers.

- **Economic Feasibility**

Besides being technically feasible, developing this system is economically feasible as well. The development of the system does not require the developers to spend a lot of money. The tools I will be using to develop the system are not expensive and the software's are open source. All I need is time. Even the maintenance of the system will not be expensive. The system is indeed economically feasible.

Security

Online quiz examination system as an important part of the assessment of student's learning outcomes, which needs to be confidential to the examinee and the related questions. The related data and operation must ensure the safety of the whole system. For system operators, admin need to assigns different operating authority. Before operating, the system needs to authenticate the user's access. Only an operator with corresponding rights is allowed to related operations, otherwise, his operations are refused. In addition, the system interfaces of the user are not allowed to access or operate are hidden. In order to ensure the data security of the system, it is necessary to strengthen the security of database management system, preventing illegal data destruction and loss of important data. In database security, mandatory access control and custom access control need to be implemented. The system assigns different user roles for different database users, and grants the permissions for user. In addition, the system needs to strengthen the management of user access permissions. Only a specific permission operator can do the corresponding operation. The system needs to adopt two methods of access control and network control, ensuring no unauthorized access to the whole system and no illegal use to each function.

Limitation of project

- In case of any type of problem in student verification no functionality is define in a system to correct it or intercommunication among user are also not available.
- Online quiz examination system is restricted to multiple choice question which can be inefficient in assessing a student's topic Mastery. Exams in the form of debates, essays, case-based questions and oral exams are difficult to conduct online.
- Online quiz examination system does not support for adding images with question so questions containing diagram can not be saved in the system.
- It has no real existence in internet just tested on localhost.
- Skip of questions is not possible and the question is not displayed randomly.
- There is no negative marking and there is no fixed time and date for online quiz exam, It can lead to excessive cheating.
- Not suitable for collaborative evaluations or group project.
- There are subject like mathematics, economic, science, that are difficult to attempt online as include formulae

Conclusion

Online quiz examination System is significantly superior among the other exams. We have come to result that the problems can be solved by introducing new security systems using biometrics, we can identify the student's true identity by analyzing digital signature or by finger print mechanism and also by providing web cameras in the examination hall. Although web cameras Sometimes gets failed, if supposed a candidate is giving exam and facing downwards in such case Iris recognition and face recognition must be used. We conclude that no mechanism is ideal. Each mechanism has some restriction on its own. Key concepts are to develop paperless environment and to convert all the documentation in digital form. With the completion of this project, we conclude that it has achieved its purpose. The whole project provides a base for students to take their exam using software and allow teacher to add questions and answers into the system. The system is developed using PHP and MySQL are saved in the database. Online quiz examination system for introduction to management course is the best compared to paper-based exam. The automated system helps students and lecturers to save time and makes the process faster. It saves space since answers papers will not be used. With a user-friendly system that has security, integrity and the database is neither inconsistent nor redundant.
